- UKERC

Alternative fuels and the hydrogen possibilities

Who is the UKHA?

- Formed in May 2006
- Diverse Membership
- Industry association whose mission is to foster the development and use of hydrogen technologies and to promote the use of hydrogen as an energy carrier in the United Kingdom
- Key activities
 - Policy
 - Regulations and Standards
 - Education
 - Collaboration
 - Desire to lead effort to develop UK hydrogen roadmap/commercialisation plan

Recent UK developments

Opportunities – micro generation

- UK firm ITM Power is developing a low cost 10kW electrolyser for refuelling hydrogen cars, at home, with renewable hydrogen. The electrolyser can also make carbon free hydrogen for application in zero carbon housing developments.

ITM's electrolyser is due to start field trials and production during 2008 .

Yorkshire Forward UK 300kW wind turbine

The Hydrogen Mini Grid System is part of Yorkshire Forward's Regional Economic Strategy that aims to:

- Reduce Yorkshire's energy demand
- Maximise the generation of low carbon energy
- Lead the way in delivering secure and reliable energy supplies.

Artificial impression

The Hydrogen Mini Grid System, HMGS, is a unique development by Yorkshire Forward to showcase the potential for Hydrogen to be used as a reliable and sustainable energy source to fuel both buildings and transport. This innovative hydrogen based energy system is based at the Advanced Manufacturing Park (AMP), Wetherley, and is a leading global example of how energy suppliers can respond to the threat posed by declining oil reserves and generate energy where it is needed.

The engineering facility being constructed at the AMP is an innovative demonstration of the infrastructure solutions required to respond to the predicted decentralisation of energy generation.

The sophisticated on-site hydrogen mini-grid system designed and managed by Inel and the Pure Energy Centre will supply the energy demands of the building and the activities of its occupants.

The Hydrogen Mini Grid System aims to:

- Create a Carbon Neutral workspace for emerging energy technology companies
- Demonstrate the use of renewable energy to generate hydrogen as part of a future Hydrogen Economy

Excess electricity generated by the on-site wind turbine will be:

- Used by the neighbouring workspaces
- Used to generate high-pressure hydrogen
- Exported to the grid

More information on the various aspects of the HMGS

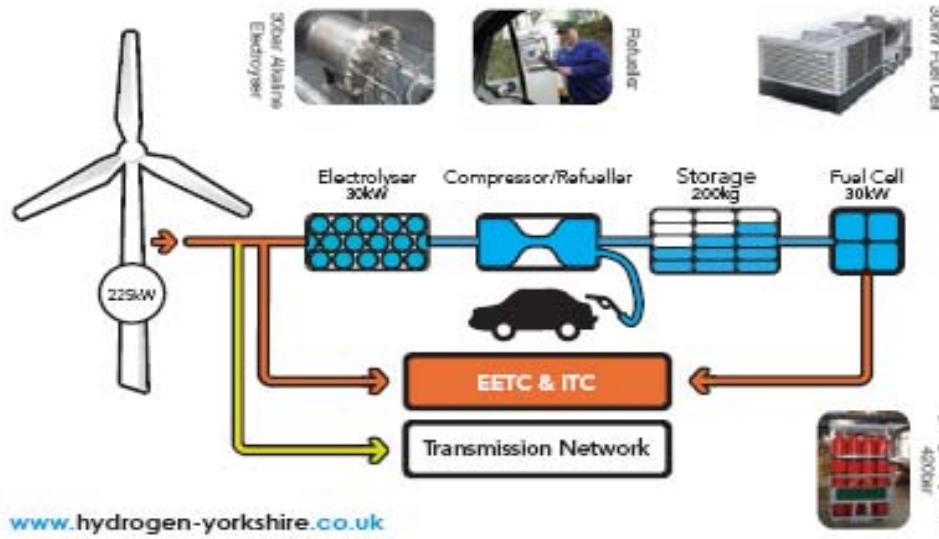

Wind Turbine – A V2P Vestas wind turbine, rated at 225kW, should generate in excess of 500MWh a year

Electrolyser – state-of-the-art 30kW electrolyser supplied by hydrogen specialists, the Pure Energy Centre, designed specifically for use with an intermittent electricity supply. Generates hydrogen at a pressure of 30bar

Hydrogen Storage – capable of storing 200kg of hydrogen at 420bar.

Hydrogen Compressor/Refueller – supplied by Air Products will dispense hydrogen at a pressure of 350bar, suitable for refuelling hydrogen vehicles.

Fuel Cell – 30kW Proton Exchange Membrane fuel cell (PEMFC) configured to supply both the EETC and the local distribution network.

- Material for Advanced Energy Systems
 - John Kilner, Imperial College

SUPERGEN

EPSRC's flagship initiative in Sustainable Power Generation and Supply.

Led by EPSRC in partnership with BBSRC, ESRC, NERC and the Carbon Trust. The initiative aims to help the UK meet its environmental emissions targets through a radical improvement in the sustainability of power generation and supply.

Consortium aims

- Multidisciplinary UK team across the academic and industrial sectors to address key technical barriers facing the UK fuel cell industry.
- To exploit synergies addressing three (traditionally distinct) fuel cell technologies;
 - High-Temperature Polymer Electrolyte Membrane Fuel Cells (HT-PEMFCs),
 - High-Temperature Solid Oxide Fuel Cells (HT-SOFCs)
 - Intermediate-Temperature Solid Oxide Fuel Cells (IT-SOFCs)
- To develop high quality researchers trained in fuel cell technology
- To communicate our research to the academic, industrial and general communities.

Supergen consortium activities (1)

•WP1 Zero Leakage SOFC

To reduce ceramic electrolyte leakage to equivalent of <1% efficiency loss
green layer processing and characterisation,
constrained sintering,
novel processing, nano-powders
process optimisation, lower sintering temperature, co-sintering
mechanical properties.

•WP2 Significantly Improved Fuel Cell Durability

Improve durability from state-of-the-art by a factor of >2
durable SOFC anodes, resistance to coking and sulphur
ageing tests, phase analysis, electron microscopy
thermal and redox cycling (particularly SOFCs)
cell and stack modelling, stack design tools
control strategies to improve durability
lifetime prediction.

Supergen consortium activities (2)

- WP3 Significantly Improved Fuel Cell Performance
 - extend PEM to 130 C (automotive) and 200 C (stationary)
 - reduce SOFC to 500 C
 - MEAs for HT-PEMFCs,
 - cathodes for HT-PEMFCs (resistant to deactivation) and IT-SOFCs,
 - electrode modelling,
 - novel routes to powders and components.
- WP4 Enhanced Fuel Flexibility
 - Liquid hydrocarbons, alcohols, biofuels
 - direct hydrocarbons in SOFC, reforming
 - resistance to sulphur and other impurities
 - less clean fuels, biogas
 - ethanol in SOFC and PEM.
- WP5 Dissemination, Outreach and Training
 - Workshops and seminars, website, UK and overseas links, UKERC.

PBI Proton Conducting Membranes for HT-PEMFC.

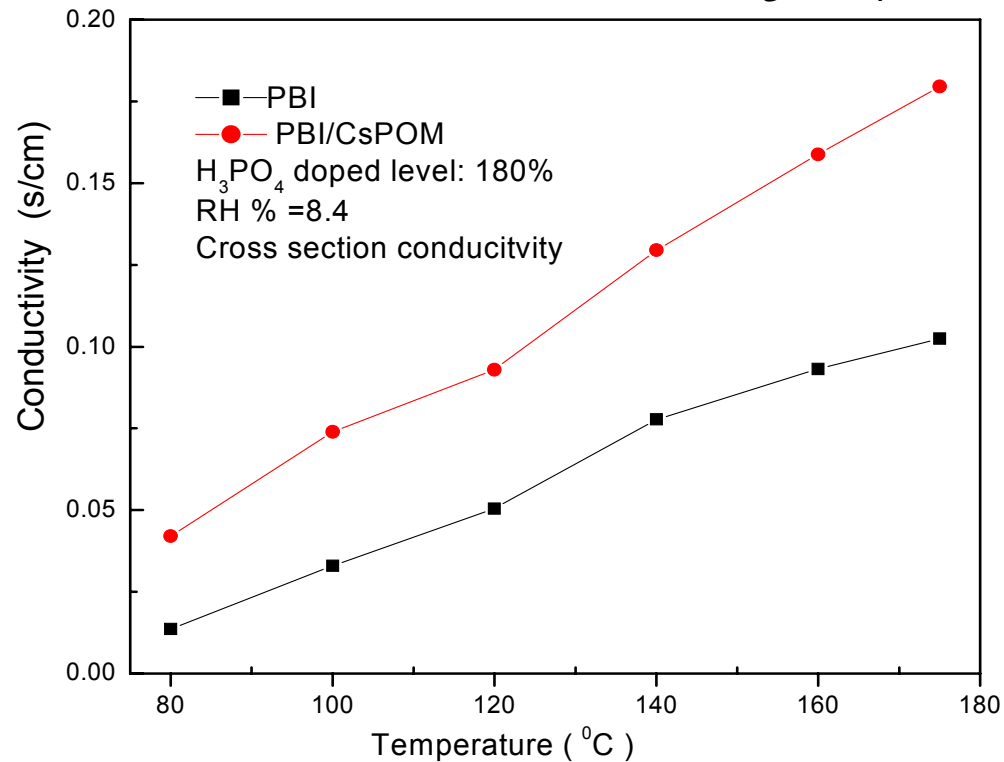

PBI High Temperature Membrane- Low Cost Option

- Polybenzimidazole synthesized from 3,3'-diaminobenzidine tetrahydrochloride and isophthalic acid by a polycondensation process in polyphosphoric acid Iwakura et al. (1964)

Composite membranes

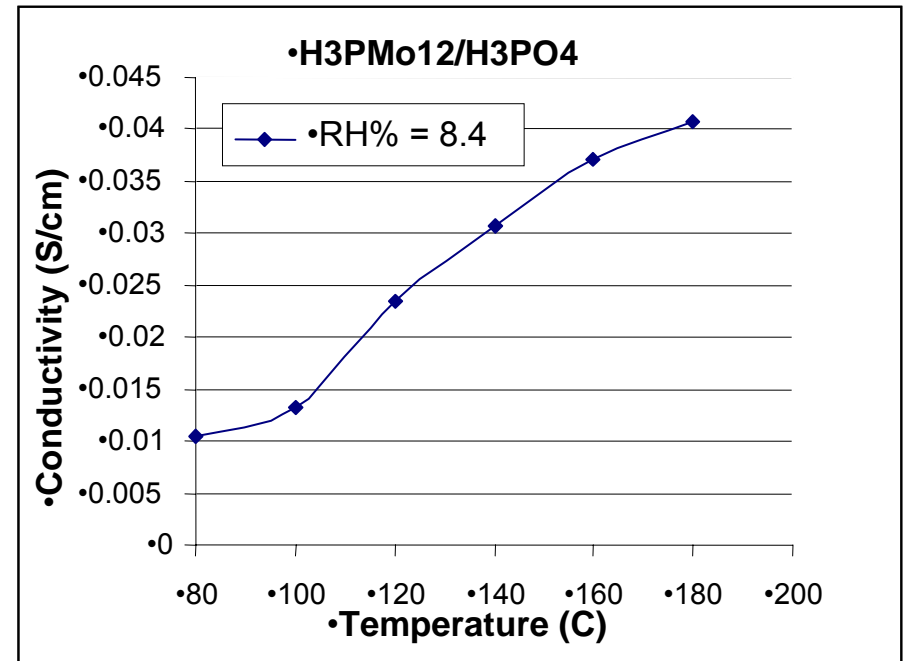

(CsPOM)/ PBI membrane doped on H_3PO_4

Conductivity of $Cs_{2.5}H_{0.5}Pm_{12}O_{40}$ (CsPOM)/ PBI membrane doped in H_3PO_4 compared to PBI doped in H_3PO_4

Other Composite Higher temperature PEM electrolytes

Mixed acid proton conductor immobilised in PTFE

Polarization and power density of a PEMFC with PBI membrane

PBI membrane doped on H₃PO₄ . Temperature: 175 °C, Loading Pt: 0.95mg/ cm²

Direct Methanol Alkaline Fuel Cell

Anode reaction:

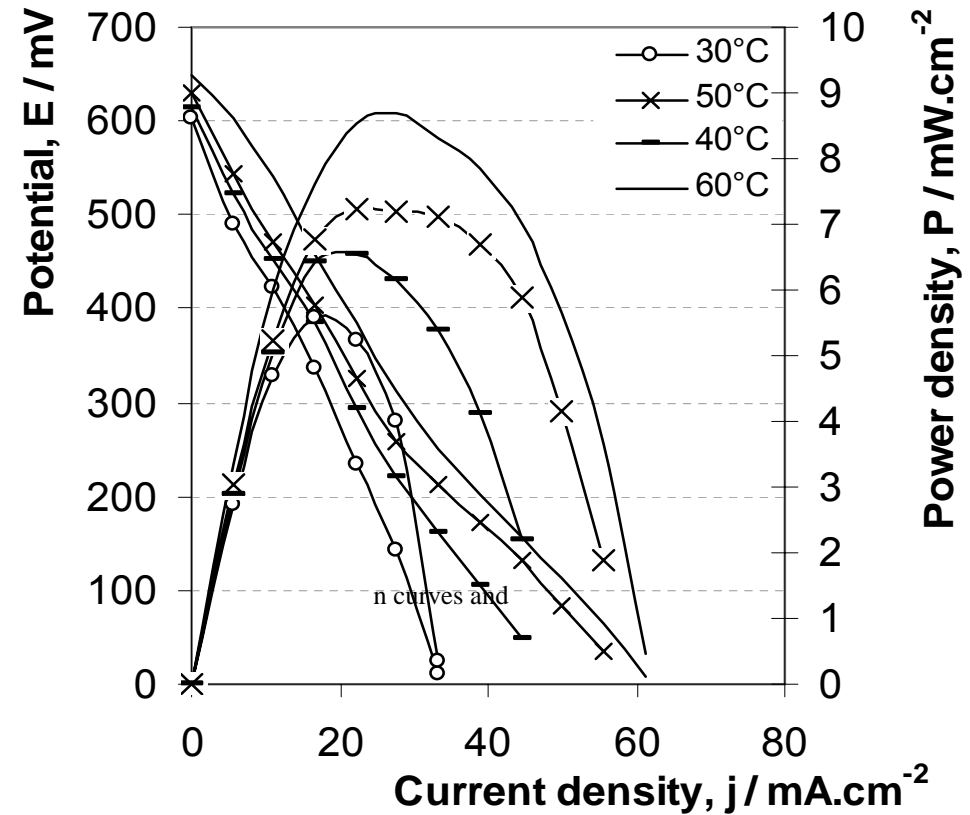

Cathode reaction:

DMAFC

-Low power densities due to un-optimised ptfе bonded electrodes

Sodium Borohydride Fuel Cell

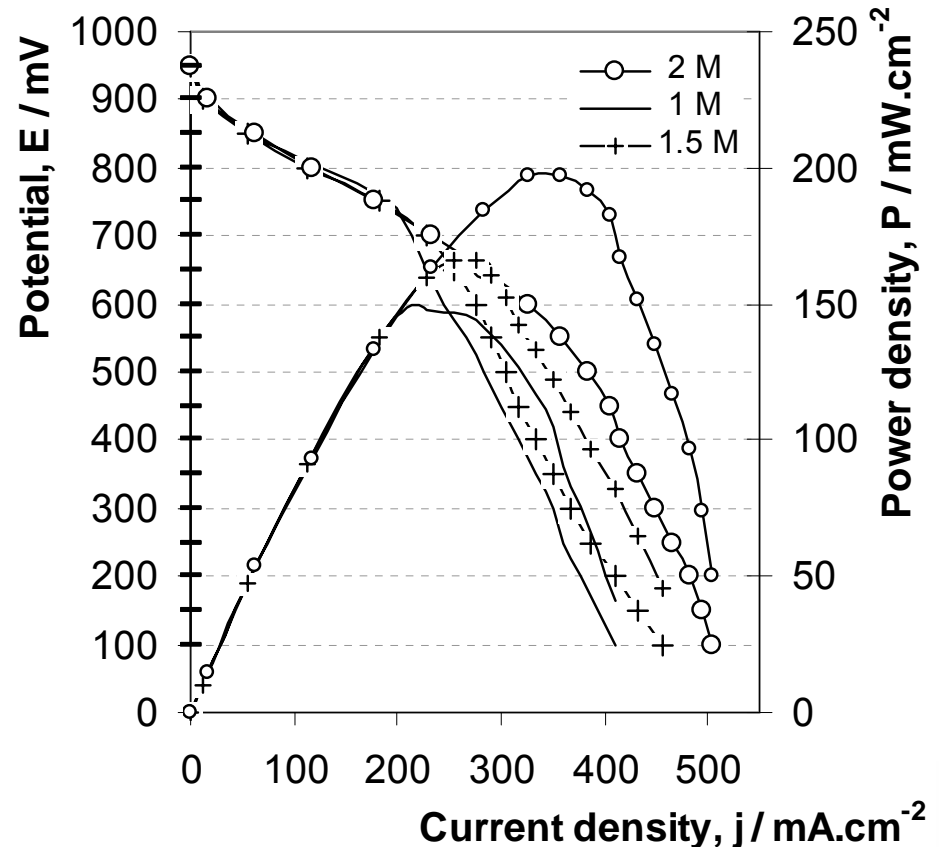

Pt/Ru anode, Pt cathode, anion exchange membrane. Power Densities > 0.12 W/cm² air

Attractions of the DBFC:

High theoretical open circuit voltage of 1.64 V

High energy density of 9285 W h (kg NaBH₄)⁻¹; **cf** 3200 Wh (kg methanol)⁻¹

- Anode: $\text{BH}_4^- + 8\text{OH}^- = \text{BO}_2^- + 6\text{H}_2\text{O} + 8\text{e}^-$ $E_0 = -1.24\text{ V}$
- Cathode: $2\text{O}_2 + 4\text{H}_2\text{O} + 8\text{e}^- = 8\text{OH}^-$ $E_0 = 0.4\text{ V}$
- Overall: $\text{BH}_4^- + 2\text{O}_2 = \text{BO}_2^- + 2\text{H}_2\text{O}$ $E_0 = 1.64\text{ V}$

Flexible Fuel Cells

Aim to produce a portable fuel cell design that offers flexibility in application, and can use several liquid based fuels.

Optimisation of electrocatalysts

Examination of oxidation of organic fuels

e.g. ethanol, formic acid, isopropanol, dimethyl ether, ethylene glycol, etc

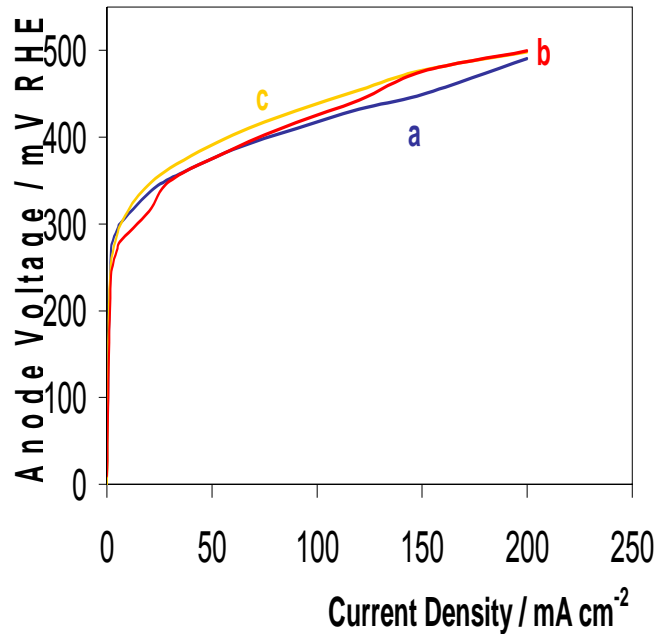

To operate at 30-60°C with air at near atmospheric pressure.

The portable fuel cell will produce 5 W power (1.2 to 2 V) using 4-6 cells.

200 μm

Comparison of Methanol Oxidation in 2M MeOH a. Conventional, b. Thermally Decomposed and c. Electrodeposited Pt-Ru catalysts

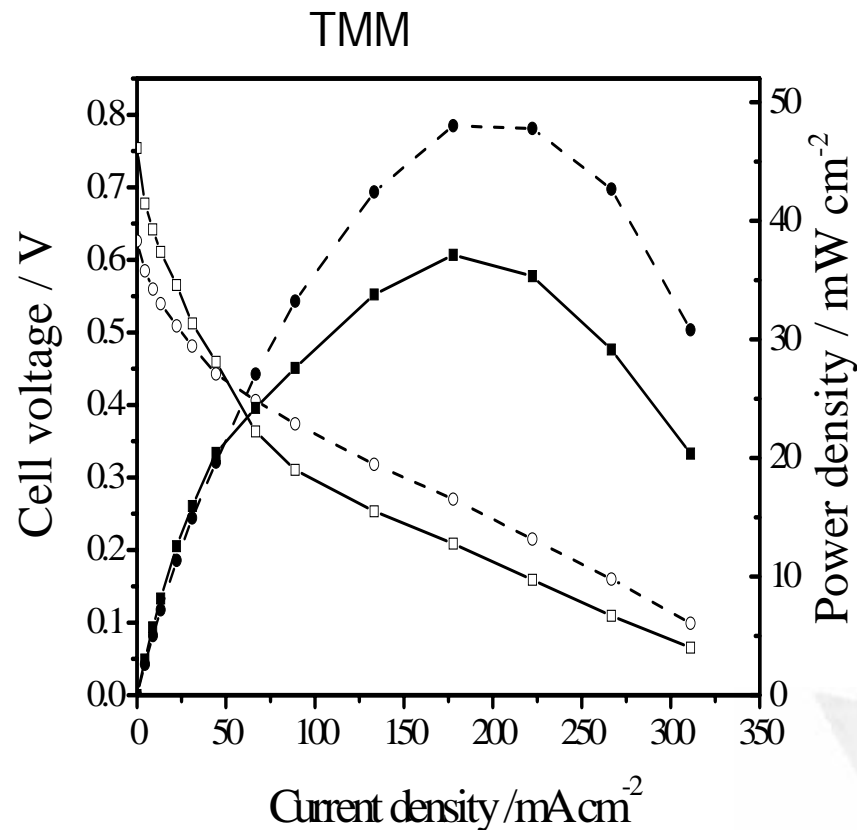

MEA constructions

a. Mesh based and b. regular

Fuel cell data- Trimethoxy methane

thermally decomposed PtRu/Ti (dotted line) and PtSn/Ti (solid line) anodes. 60oC. Anode catalyst loading 2 mg cm⁻² and cathode catalyst: 2 mg cm⁻², 60 wt.% Pt/C (E-Tek).

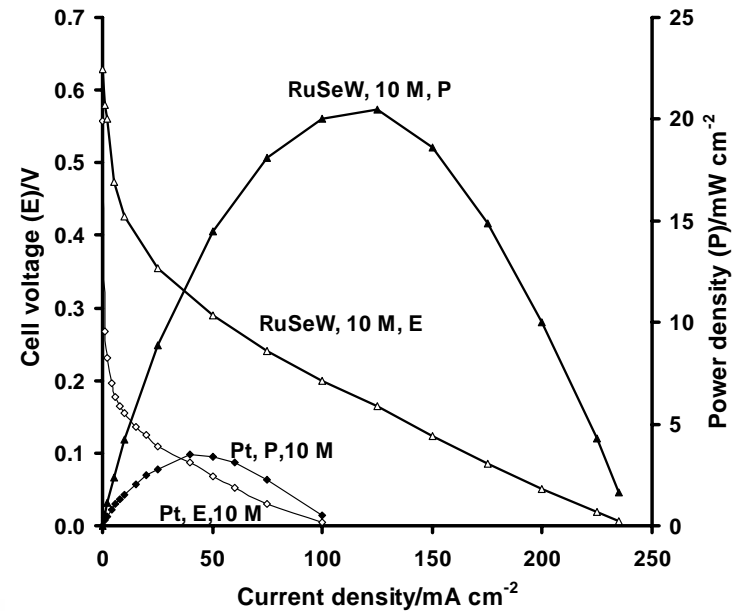

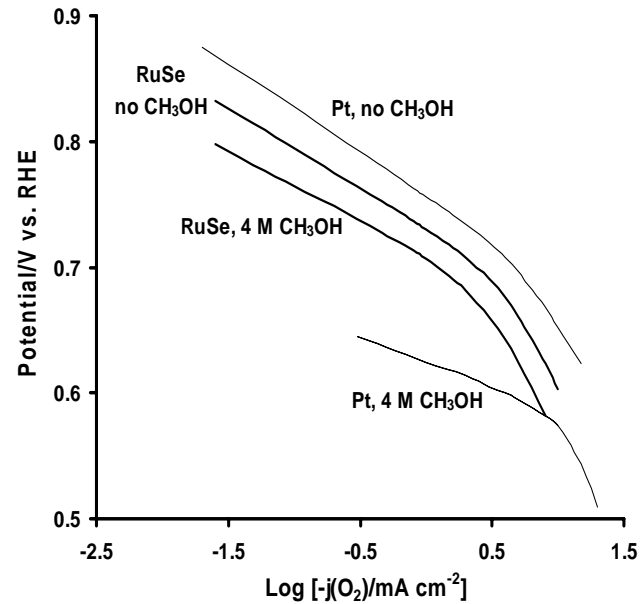

METHANOL TOLERANT CATHODES

- **TETRAMETHOXYPHENYLPORPHYRIN**
FeTMPP-Cl and CoTMPP-Cl
- **Platinum based Binary catalysts**
Pt-Co, Pt-Cr, Pt-FeO_x
- **Ruthenium based binary and ternary catalysts**
Ru-Se-Mo, Ru -Se , Ru-S-Mo
- **Rhodium based catalysts**

DMFC with Ru-Se Cathodes- Effect of Methanol Concentration

Concentration

MIXED REACTANT FUEL CELL (MRFC) IS POSSIBLE

- No need for gas-tight structure within the stack- providing relaxation of sealing the reactant/products delivery structures.
- Minimum membrane thickness possible- reduced Ohmic voltage losses
- Simplified manifolding.
- No bipolar plate needed.
- Much Cheaper than conventional fuel cells.

Issues

- Selective electrocatalysts mandatory.
- Reduced cathode voltage
- High Ohmic resistance between neighboring cells, when a strip-electrode configuration is used.
- Increased Fuel and Oxidant Dilution.
- Crossover inevitable.
- Safety with explosive gas mixtures

Newcastle Achievements Include

- First UK DMFC (PEM) 0.5 kW Stack in 1999
- First to demonstrate alkaline membrane in DMFC
- Titanium mini-mesh supports for anode (and cathode catalysts)
- Fabrication of tubular capillary MEA
- DMFC with methanol tolerant non-platinum catalysts
- First to demonstrate mixed reactant DMFC with PEM
- 50 W DMFC with mesh based flow fields
- Room temperature borohydride fuel cells

Further Improvement and System Integration of High Temperature Polymer Electrolyte Membrane Fuel Cells

Project partnership

Research/Industry/tasks

- 1-Technical Univ. of Denmark (DK) (coord, membranes, electrodes)
- 2-Volvo Technology Corp. (SE) (enduse, test, model., simul., safety)
- 3-Norwegian Univ. of Science and Technology (NO) (cat. electr.)
- 4-Univ. of Newcastle upon Tyne (UK) (training, electr., DMFC)
- 5-Elsam A/S (DK) (Finished task 2006) (utility application)
- 6-Danish Power Systems ApS (DK) (MEA manufacturing)
- 7-Case West Reserve University (USA) (“consultancy”)
- 8-University of Stuttgart (DE) (membranes)
- 9-HyGear B.V. (NL) (reformer, system)
- 10-Freudenberg FCCT (DE) (GDL, sealing)
- 11-IRD Fuel Cell A/S (DK) (stacking)
- 12-Foundation of Research and Technology (GR) (reformer cat. etc.)
- 13-Between Lizenz GmbH (DE) (membranes, MEA)

Objectives

WB0 Membrane/MEA development

- ☞ PBI modification and new membranes
- ☞ Electrodes and MEA's

WB1 Stacking

- ☞ Updating LT to HT with new materials

WB2 Diesel reformer system

- ☞ For APU

WB3 Modelling/simulation

- ☞ Of cells and system
- ☞ System control and safety

WB4 Training

- ☞ Workshop/symposium/summer school
- ☞ University courses

Project Achievements

- ☞ WP0 Membranes and MEA's
- ☞ Target: 0.6V - 0.7mA/cm²
- ☞ Blend membrane
 - ☞ (DTU/DPS + U. Stuttgart/BTW)
 - ☞ PBI/SFS
 - ☞ Paper under way: Li/Kerres et al. *J. Membr. Sci.*
- ☞ Cross linking PBI (covalent)
 - ☞ Paper: Li et al. *Chemistry of Materials* (2007)
- ☞ GDL and sealing from Freudenberg
- ☞ Catalyst: Johnson Matthey + DTU + NTNU
- ☞ Improved performance
 - ☞ 0.6V - 0.6 mA/cm² at 200°C, H₂/air

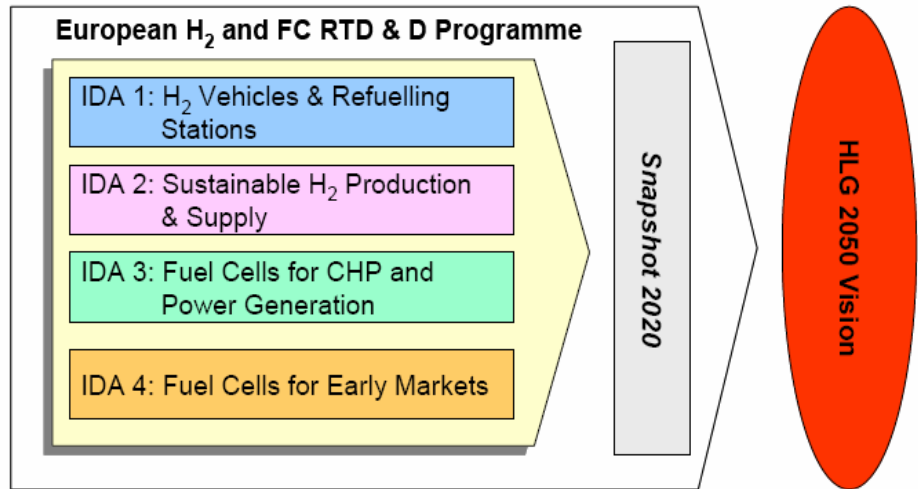

Hydrogen and Fuel Cell Review Days 2007, Brussels 10th-11th October

5 kW Stack System with Diesel Reforming

**Innovation
and
Development
Actions**

IDA 1 : Hydrogen Vehicles and Refuelling Stations

Goal: Improve and validate hydrogen vehicle and refuelling technologies to the level required for commercialisation decisions by 2015 and a mass market-rollout by 2020

IDA 2: Sustainable Hydrogen Production and Supply

Goal: 10-20% of the Hydrogen supplied for energy applications to be CO₂ lean or free by 2015

IDA 3: Fuel Cells for CHP and Power Generation

Goal: Commercially competitive Fuel Cells for CHP and Power Generation; > 1 GW

IDA 4: Fuel Cells for Early Markets

Goal: X000 commercial early market FC products in the market by 2010.

The target for this IDA, on the way to reaching the “Snapshot 2020” milestone, is to achieve cumulative production of 200MW (circa 20,000 units) not later than 2012.

Water Electrolyser Research in the EU

- **Medium temperature PEMs are an important topic of the Strategic Research Agenda and of the scoping paper for collaborative R&D in the International Partnership for the Hydrogen Economy.**

The European Community funded strategic research on hydrogen electrolysers and related PEMFC technology and materials includes:

- **Development of low temperature high pressure PEM electrolyser.**
Under FP5 (1999-2002) HYSTRUC
- **Develop small scale low temperature PEM electrolysers.**
GenHyPEM [<http://www.genhypem.u-psud.fr>; 2005-2008] 1.1 M euro 6 partner
- **Solid oxide electrolysers**
Under FP6, Hi2H2, a STREP with 4 partners 1.1M euro
- **Lower temperature PEM electrolyser (120 oC).**
In 2008 “small and medium scale focused research project” on “New material processes for advanced electrolysers” (WELTEMP) with 6 partners (2.38M euro).

Conclusions

Fuel Cell Applications Continue to Increase Rapidly

Hydrogen Fuelling Stations beginning to appear

Electrolyser Future Market Size Expanding

Year	2010	2020	2030	2040	2050
UK H ₂ production potential from wind+marine+solar (TWh)	9.8	103	197	289	383

A report produced by Professor Marcus Newborough
